Nuclear Medicine Department

The PET/CT is an imaging method that combines the techniques of PET (Positron Emission Tomography) and CT (Computer-Assisted Tomography), and providing more comprehensive information than each can separately provide. This combination ensures rapid and accurate cancer diagnosis.

Used in the diagnosis and monitoring of cancer, PET/CT is the fastest and most accurate method. It is the result of combining PET (Positron Emission Tomography) and CT (Computer-Assisted Tomography) in one device.

PET/CT is the most advanced method in the world used in the diagnosis and monitoring of cancer and it has many advantages for both doctors and patients. Anadolu Medical Center is one of the few centers in Turkey using this device.

Gamma Knife: Beyin tümörlerinin cerrahi işleme gerek kalıramasız tedavisi için kullanılan Gamma Knife genel anestezi ve yoğun bakım gerektirmeyen bir radyocerrahi yöntemi. Tek seans uygulanan Gamma Knife tedavisi sonrasında hastaların çoğu, genellikle aynı gün evine dönebiliyor.

A linear accelerator (LINAC) Customizes high energy x-rays to conform to a tumor’s shape and destroy cancer cells while sparing surrounding normal tissue. It features several built-in safety measures to ensure that it will not deliver a higher dose than prescribed and is routinely checked by the medical physicist to ensure it is working properly.
Emergency Services in Koru Ankara Hospital perform services continuously among the day successfully, treated the urgent cases by well trained staff and the specialist of this field, with its fully equipped all the necessary modern equipments.
